

Deframe Quick Start Guide

- Install Deframe in your Applications folder and launch the application.
- From the Project menu, you may select "New". A project document window will be displayed.
- Click the "import" item on the toolbar to load one or more movies into your Deframe project. (You may also drag movies from the Finder onto the Tray)
- Select a movie from the tray to begin your work.
- Create one or more extractions for the selected movie by clicking the appropriate extraction item from the toolbar or the "Extractions" menu.
- To modify an extraction, select it and make the desired changes in the extraction details section of the window. To prevent future unwanted changes, click the lock button on the extract details header.
- Once you have the extraction specified as you would like in the details section, click the export button on the extract detail header to create a file version of the extraction. To export all extracts for a particular movie, click the "Export" item on the toolbar.

Have Fun!
