

VideoWebWizard 2.0 Tutorial

Please Register Your Copy of VideoWebWizard!

[Click Here To Register For Updates](#)

1. After installing VideoWebWizard, open it.

You will get the following welcome screen. **Click "Next."**

2. In Step 1, you will add your input video(s) and choose your output folder. At the last step, VideoWebWizard will convert your input videos and save them in your output folder.

Click the "Add New Video" button to add a video that's on your hard drive.

Click the "Add YouTube Video" button if you already have a video on YouTube that you want to use.

After adding a video, you can optionally edit the **Output Video File Name** and **Video Title** by double clicking on them.

Highlight a video and then click **"Remove Selected Video(s)"** to remove it.

Highlight a video and then click the **"Up/Down"** arrows to rearrange it in your playlist order.

Click the "Browse" button to choose an output folder.

To continue, click "Next."

The screenshot shows the 'Step 1: Input/Output Selection' window of VideoWebWizard 2.0. The window title is 'VideoWebWizard 2.0 - Put Streaming Flash Video On Your Website'. The main heading is 'Step 1' with the subtitle 'Input/Output Selection'. Below this, it says 'Add input video(s). Support formats include AVI, WMV, MOV, MPG, FLV, VOB, ASF, and MP4.' There is a table with three columns: 'Input Video File Name', 'Output Video File Name', and 'Video Title'. The first row has 'funny' in the first two columns and 'John's Funny Video' in the third. To the right of the table are up and down arrows. Below the table are three buttons: 'Add New Video', 'Add Youtube Video', and 'Remove Selected Video(s)'. Below these buttons is a text box with 'C:\Web Video\' and a 'Browse' button. At the bottom are four buttons: 'Register for Updates', '< Back', 'Next >', and 'Cancel'.

	Input Video File Name	Output Video File Name	Video Title
▶	funny	funny	John's Funny Video

Buttons: Add New Video, Add Youtube Video, Remove Selected Video(s)

Select the output folder where the converted video and .HTML webpages should be saved to

C:\Web Video\ Browse

Buttons: Register for Updates, < Back, Next >, Cancel

3. You will choose the output quality of the new video file(s) in Step 2.

If you would like, simply choose one of the presets...

"Dial-Up" – for videos designed for dial-up viewers (low quality)

"Cable" – for videos designed for cable/DSL viewers (most common)

"Office LAN" – for local-area-network viewers (very high quality)

"Original Values" – use the video's original quality settings (can lead to large file sizes)

You can also control the quality settings manually.

"Constrain Proportions" – check this & choose a video resolution to prevent video stretching

"Resolution" – sets the width and height of the output video

"Frame Rate" – sets the number of frames per second

"Video Bitrate" – sets the video bitrate (Setting it low will create a small file size, but with low quality. Setting it high creates a large file size, but with high quality.)

"Audio Mode" – sets the audio to mono or stereo (Stereo uses a higher-quality two-channel audio, but increases the video file size & load time.)

"Audio Bitrate" – sets the audio bitrate (Setting it low will create a small file size, but with low quality. Setting it high creates a large file size, but with high quality.)

"Sampling Rate" – sets the audio sampling rate (Setting it low will create a small file size, but with low quality. Setting it high creates a large file size, but with high quality.)

You can add and remove custom presets with the "Plus" and "Minus" buttons. To reset presets to their "factory defaults," click the "Reset Presets" button.

To use a video skin on the next step, you must choose "320x240 Skin" or "YouTube Skin" under "Resolution."

VideoWebWizard 2.0 - Put Streaming Flash Video On Your Website

 **Step 2**
Set the output quality of the video

Preset	Preset Name
Dial-Up (56 Kbps)	Dial-Up (56 Kbps)
Cable (5 Mbps)	
Office LAN (100 Mbps)	
Original Values	

☐ Constrain Proportions

Resolution: Original

Frame Rate: 8

Video Bitrate: 32

Audio Mode: Mono

Audio Bitrate: 24

Sampling Rate: 11,025

4. Next, simply choose the player that you would like your video to be played in on your website, and click "Next."

If you are converting multiple videos, you must use one of the included playlist players.

If you opted to use a video skin at Step 2, choose one here also.

4b. At Step 3, you can access more features of the software and of your chosen video player by clicking the **"Advanced Player Options"** button.

Click "Browse" under to **"Initial Screen"** to pick a thumbnail image. This thumbnail image will appear in the player until the video starts.

Check the **"Disable Sound Effects"** checkbox to disable player sound effects. (This does not disable the sound of your video)

Enter a URL, such as <http://www.yourhostsite.com/videos/>, in the **"External FLV Hosting"** textbox if you would like to host your FLV videos at another location than where the video will be displayed.

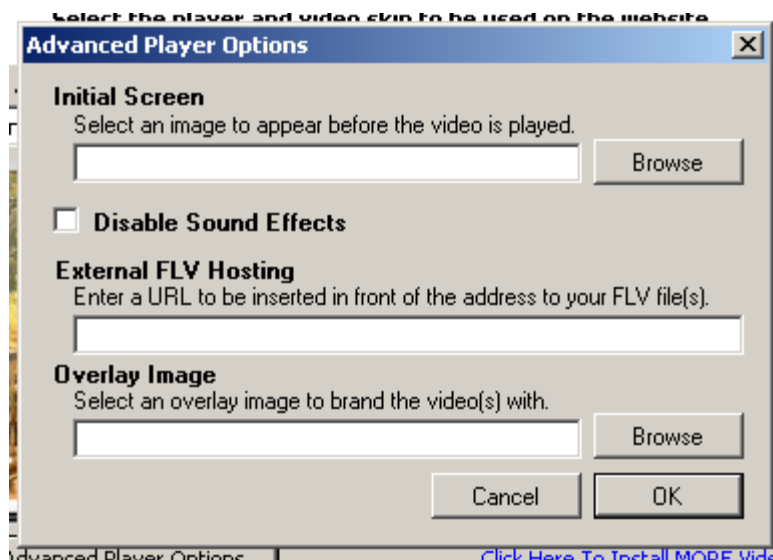

[Click here for a tutorial](#) on how to use Amazon's S3 media hosting service. Amazon S3 is great for hosting just your videos, images, and large files, especially if you plan to get a lot of traffic!

Click "Browse" under **"Overlay Image"** to choose an image/logo to brand your video with.

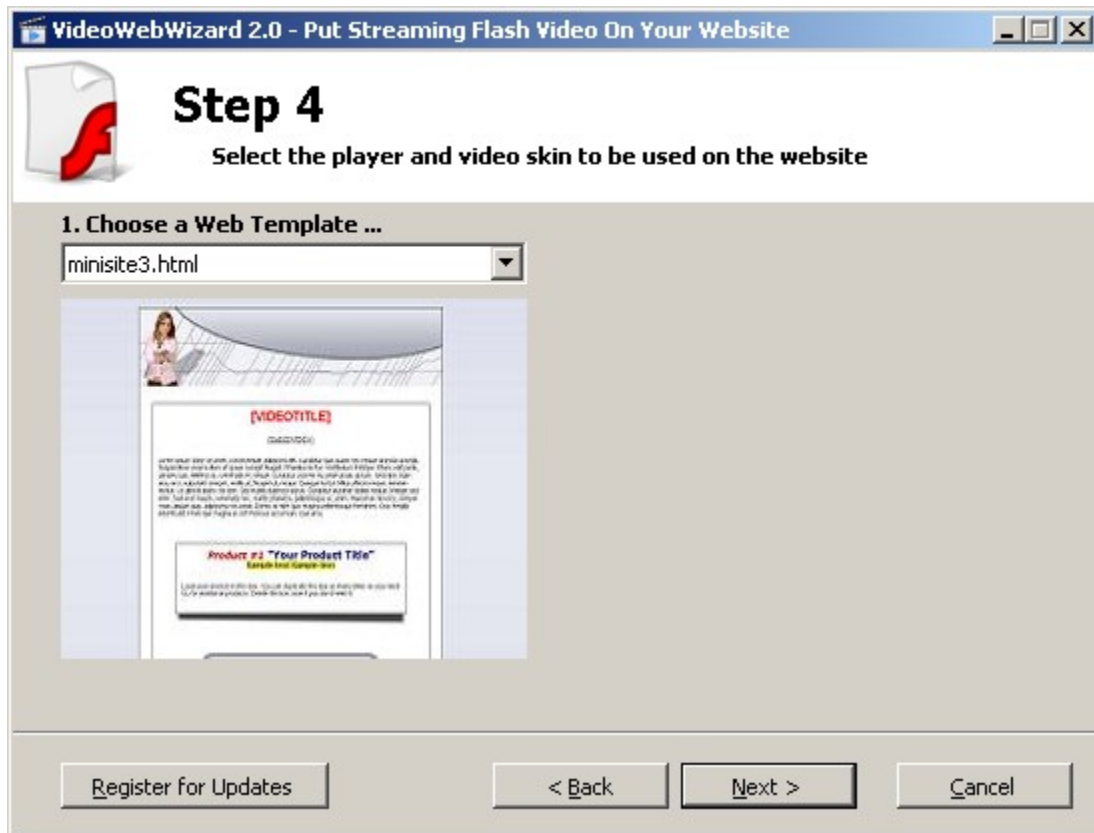

[Click here](#) to download an Overlay Image template and further instructions!

5. You will choose a web template at Step 4. These are premade web templates that you can use. The software simply inserts your video into any of them.

If you would only like a basic web page, choose the "Default Web Template" option.

6. It's not absolutely necessary to change anything at step 5, but there are some neat features. All are explained here.

Page Title – The text you enter will show as the title of the browser window

Page Header – The text you enter will appear above your video as a title

Project Name – The name you enter here will be used to name the output
Flash (FLV) file & web page file

Generate Code – If checked, software gives you just the video code instead
of generating a web page that contains the video code.

Affiliate ID – Earn money! If you enter an affiliate ID ([click here](#) for details),
a link to VideoWebWizard.com will be added below your video.
If someone clicks on it & order VideoWebWizard, you earn money!

Buffer Time – Specify how much the player should load the video before
playing so that there are no pauses during playing. (A value of
2-5 is usually fine.)

Auto-Start Video – If checked, the video will start automatically as soon
as the page loads.

Completion URL – If a URL is entered, the viewer will be redirected to that
URL as soon as the video has finished playing.

VideoWebWizard 2.0 - Put Streaming Flash Video On Your Website

Step 5

Modify the HTML webpage and player settings

Page Title: John's Web Page

Page Header: John's Funny Video

Project Name: funny

Generate Code (Instead of HTML file): ☐

Affiliate ID (optional): johnaff [More Info \(earn money!\)](#)

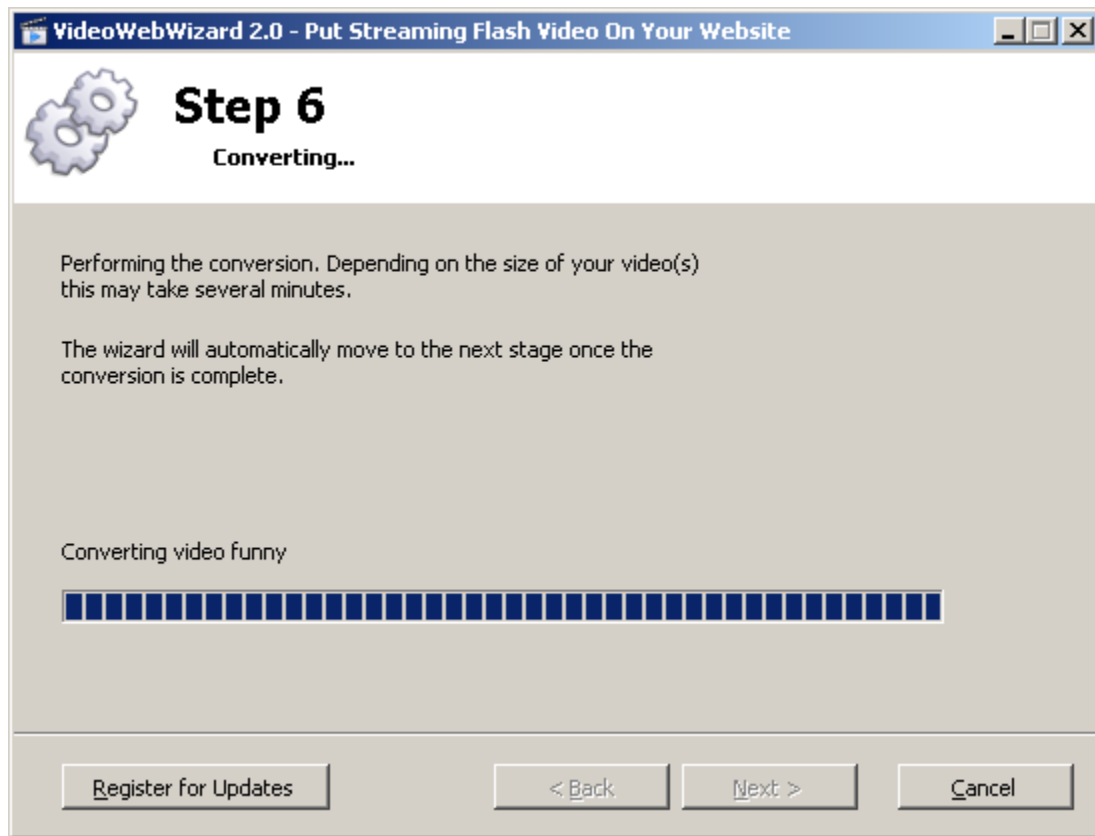

Buffering Time (s): 4

Auto-Start Video: ☐

Completion URL: http://www.john.com/home.html

7. VideoWebWizard will convert your file to Flash (FLV) web format.

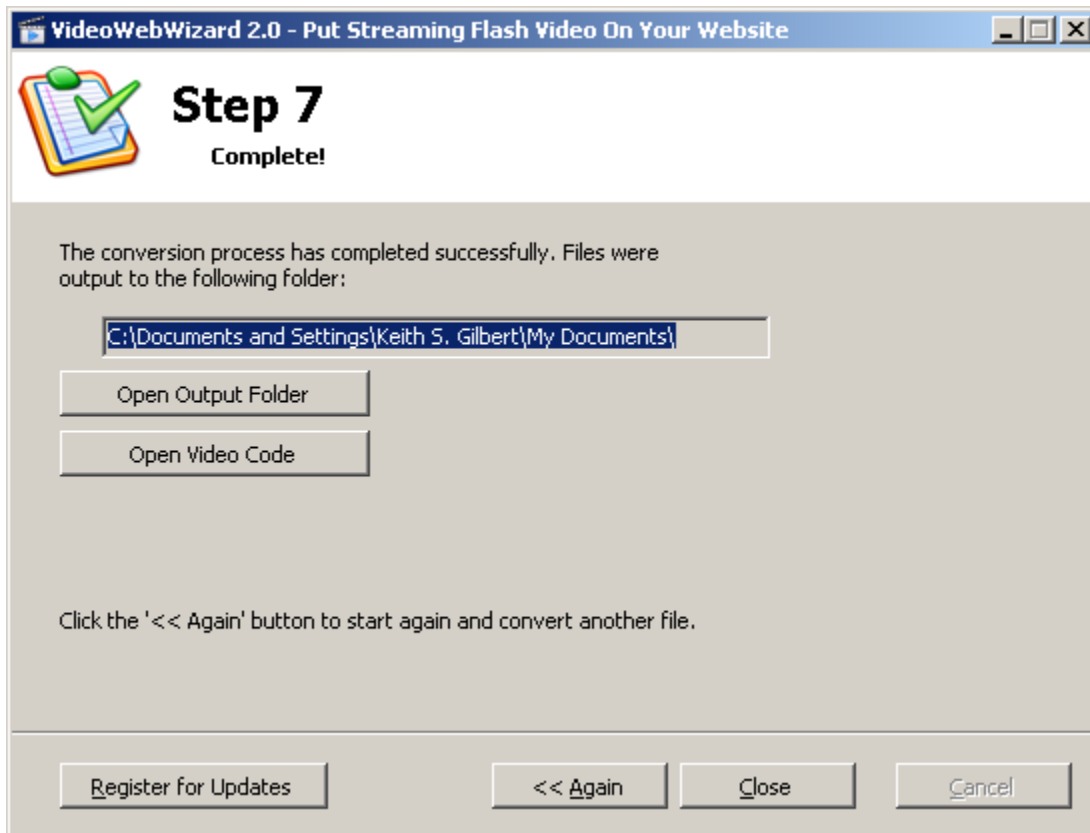

7. Your video is now converted!

Click "Open Output Folder" to view the converted file. To view your video, double-click on the web page called "index" – or whatever you set as your "Project Name."

Then proceed to the next step for instructions on how to upload your video.

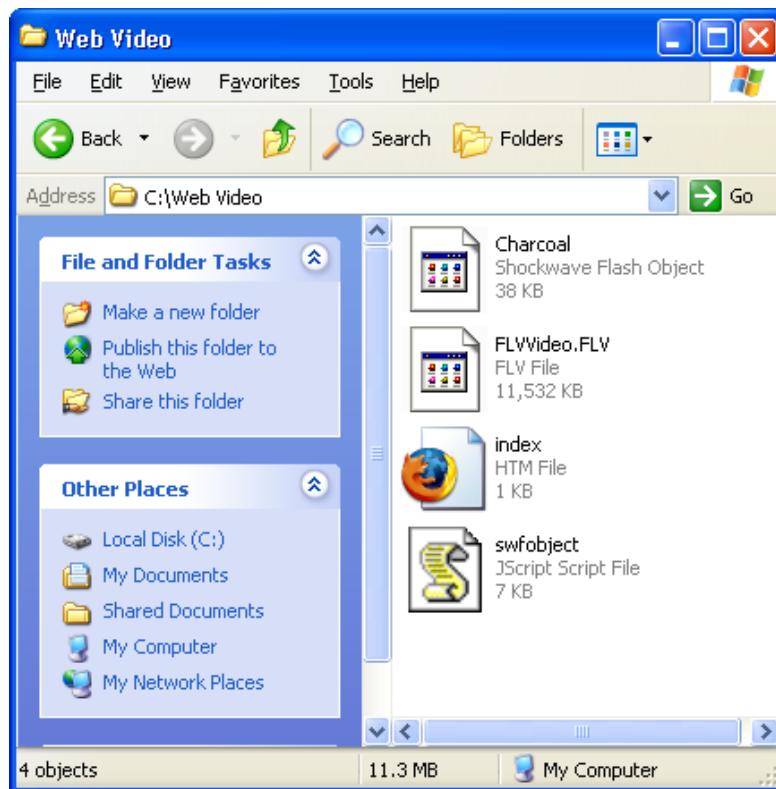

If you used the "Generate Code" feature at Step 5, click the "Open Video Code" button to get the HTML code for your video. **IMPORTANT:** After pasting your video code into your web page, make sure you upload the converted files into the same directory as the web page. Otherwise, your video will not play.

8. Finally, upload **all** the converted files to your web server. Your video will not play if all files are not present.

The easiest way to get your video online is to set your "Project Name" to index (this is the default) and upload all the converted files into a brand-new directory on your website.

Then, you can simply view your video at <http://www.YourSite.com/NewDirectory/>.

Congratulations!

**You've completed the tutorial and now know how to use
VideoWebWizard!**

I hope you enjoy using VideoWebWizard and find it to be an extremely useful piece of software. Also, I highly recommend you [register for VideoWebWizard updates](#) to be notified of new versions, patches, and updates for VideoWebWizard.

Thank you!
